Priority number(s):

Abstract of JP10241992

PROBLEM TO BE SOLVED: To not only reduce an electrostatic capacity of a laminated capacitor but also regulate the electrostatic capacity by trimming in an increasing direction.
SOLUTION: By using the laminated capacitor having a trimming electrode 19 formed on a surface of a laminated component assembly 13 or near the surface opposed to at least a pair of inner electrodes 18 formed in the assembly 13, a laser beam is emitted to the electrode 19 to partly reduce a regulating layer 21 between the electrode 19 and the electrodes 18. Thus, the electrode 19 is brought in continuity with the one electrode 18 via a short-circuiting part 20. Thus, after an electrostatic capacity value of the capacitor is increased, the beam of smaller output than that at the time of trimming is emitted to the electrode 19, and the electrode 19 is cut without reducing the layer 21.
